

Your Health and Safety Matters!

November is Diabetes Awareness Month

Diabetes Fact Sheet

Diabetes is increasing at an alarming rate in the United States. Below is a summary of the latest diabetes statistics included in the CDC's 2020 report.

How Many People Have Diabetes?

1 in 10
HAVE DIABETES
that's more than 30 million people

A graphic consisting of the text '1 in 10 HAVE DIABETES' in blue and orange, with 'that's more than 30 million people' in a smaller blue font below it. To the right of the text is a stylized orange drop icon with a white drop inside.

Diabetes

- **Total:** 34.2 million people have diabetes (10.5% of the US population)
- **Diagnosed:** 26.9 million people, including 26.8 million adults
- **Undiagnosed:** 7.3 million people (21.4% are undiagnosed)

Prediabetes

- **Total:** 88 million people aged 18 years or older have prediabetes (34.5% of the adult US population)
- **65 years or older:** 24.2 million people aged 65 years or older have prediabetes

New Cases of Diabetes in Adults and Children

New Cases of Diabetes in Adults and Children

Among people 18 years or older, 1.5 million were newly-diagnosed with diabetes (2015)
– approximately 4,657 new cases of diabetes are diagnosed each day.

The incidence of type 1 diabetes is significantly higher in people under age 20. According to a 2011-2012 study of 23,525 youths with diabetes, 78% were newly-diagnosed with type 1 diabetes vs. 22% who were newly-diagnosed with type 2 diabetes.*

- About 210,000 Americans younger than 20 years have diabetes (type 1 or type 2) which represents 0.25% of all people in this age group
- More than 18,000 youth are newly diagnosed with type 1 diabetes annually
- Nearly 6,000 youth are newly diagnosed with type 2 diabetes annually

Diabetes impacts all social, economic, and ethnic backgrounds.

What are the symptoms of diabetes?

A: Knowing the warning signs for type 1 diabetes could help save a life! Type 1 diabetes can often go undiagnosed in its early stages because the symptoms can be mistaken for more common illnesses, like the flu. Take notice if you or your loved one experiences the following:

- *Extreme thirst*
- *Frequent urination*
- *Drowsiness and lethargy*
- *Sugar in urine*
- *Sudden vision changes*
- *Increased appetite*
- *Sudden weight loss*
- *Fruity, sweet, or wine-like odor on breath*
- *Heavy, labored breathing*
- *Stupor or Unconsciousness*

Call your doctor immediately if one or more of these symptoms occurs in you or your loved one. It is extremely important to receive medical attention—misdiagnosis or leaving your condition untreated can have *tragic consequences, including death*.

The Basics

More than 34 million people in the United States have diabetes, but 1 out of 5 of them don't know they have it. There are three main types of diabetes: type 1, type 2, and gestational diabetes (diabetes while pregnant, which can put the pregnancy and baby at risk and lead to type 2 diabetes later). With type 1 diabetes, your body can't make insulin (a hormone that regulates blood sugar), so you need to take it every day. Type 1 diabetes is less common than type 2 diabetes; about 5% of the people who have diabetes have type 1. Currently, no one knows how to prevent type 1 diabetes.

Most people with diabetes—9 out of 10—have type 2 diabetes. With type 2 diabetes, your body doesn't use insulin well and is unable to keep blood sugar at normal levels. If you have any of the risk factors below, ask your doctor if you should be tested for diabetes. The sooner you find out, the sooner you can start making healthy changes that will benefit you now and in the future.

Diabetes by the Numbers

- 34.2 million US adults have diabetes—and 1 out of 5 of them don't know they have it.

- At least 1 out of 3 people will develop diabetes in their lifetime.
- Medical costs for people with diabetes are twice as high as for people without diabetes.
- Risk of death for adults with diabetes is 50% higher than for adults without diabetes

Type 2 diabetes risk factors include:

- Being overweight.
- Being 45 years or older.
- Having a parent, brother, or sister with type 2 diabetes.
- Being physically active less than 3 times a week.
- Ever having gestational diabetes or giving birth to a baby who weighed more than 9 pounds.

Diabetes kills more
Americans every year than
AIDS and breast cancer
combined

Diabetes may be underreported as a cause of death. Studies have found that only about 35% to 40% of people with diabetes who died had diabetes listed anywhere on the death certificate and about 10% to 15% had it listed as the underlying cause of death.

Race and ethnicity also matter: African Americans, Hispanic/Latino Americans, American Indians, Pacific Islanders, and some Asian Americans are at higher risk for type 2 diabetes.

You've Been Diagnosed with Diabetes. Now What?

It's a balancing act—food, activity, medicine, and blood sugar levels—but you can do it. Manage your diabetes throughout the day by

Keep it fresh by shopping the outside aisles of the grocery store for fruits, veggies, lean meat, and dairy.

- **Following a healthy eating plan**, including eating more fruits and vegetables and less sugar and salt.
- **Getting physically active** —10 to 20 minutes a day is better than only an hour once a week.
- **Taking diabetes medicine** as prescribed by your doctor.
- **Testing your blood sugar** regularly to understand and track how food, activity, and medicine affect your blood sugar levels.

Learning how to take care of your diabetes starts when you're diagnosed, but it doesn't stop there. As you get older or if your health status changes, your treatment plan may need to change too.

Know Your ABCs

Work with your doctor to manage your diabetes ABCs, and keep a record of your numbers. Results will help determine if your treatment plan is working and you're able to stay in your target range—for example, an A1C

of 7% or less—or if adjustments need to be made. Staying on track will help lower your risk of additional health problems.

- **A**—the A1C test, which measures average blood sugar over 2 to 3 months.
- **B**—blood pressure, the force of blood flow inside blood vessels.
- **C**—cholesterol, a group of blood fats that affect the risk of heart attack or stroke.
- **S**—stop smoking or don't start.

Prevent Complications

People with type 1 or type 2 diabetes are at higher risk for serious health complications, including

- **Heart disease and stroke:** People with diabetes are twice as likely to have heart disease or a stroke as people without diabetes, and at an earlier age.
- **Blindness and eye problems:** Diabetic retinopathy (damage to blood vessels in the retina), cataract (clouding of the lens), and glaucoma (increase in fluid pressure in the eye) can all result in vision loss.
- **Kidney disease:** High blood sugar levels can damage the kidneys over time, long before you start to feel bad.
- **Amputations:** This means you could lose a foot or leg. Diabetes causes damage to blood vessels and nerves, particularly in the feet, and can lead to serious, hard-to-treat infections. Amputation may be necessary to keep the infection from spreading.

But controlling your blood sugar levels can help you avoid or delay these serious health complications, and treating complications as soon as possible can help prevent them from getting worse.

Put Care on Your Calendar!

Every day: stay active, eat a healthy diet, and take medication if prescribed; check feet for redness, swelling, pain, or sores.

Each health care visit (at least 4 times a year): blood pressure check; foot check.

Twice a year: A1C test; dental checkup.

Once a year: cholesterol test; kidney function test; podiatrist (foot doctor) and eye doctor visits; flu shot (and other vaccines as recommended by your doctor).

Living with diabetes has its ups and downs, but healthy lifestyle choices can give you more control over them. And more control means fewer health problems down the road and a better quality of life *no*

There isn't a cure yet for diabetes, but a healthy lifestyle can *really* reduce its impact on your life. What you do every day makes the difference: eating a healthy diet, being physically active, taking medicines if prescribed, and keeping health care appointments to stay on track.
